

To get information about a clip in a clipbin, you can use the "Clip Properties..." command from the right-click menu of a clip.

This command launches a separate dialog box, revealing such properties as type, clip name, TV format and so on. The lower part of the dialog shows the available footage and where it is physically stored. The status tells you if the footage is "Online" - meaning it is available, "Offline" - meaning it is stored on an HSM and not available and "N/A" meaning the footage is not available.
